ARGO-GIM
INSIDE INSIGHT

EXECUTIVE SUMMARY
OCTOBER 2026 · NEW-TALE

Your gut, seen from the inside. A capsule you swallow at home that combines imaging and biosensors in a single exam, with no bowel preparation.

STAGE: CONCEPT AND DESIGN · TALENTIS 2026 FINALIST

THE PROBLEM

Colorectal screening exists, but it does not reach people. In Italy only 35.8% of those invited take the test, falling to 21.1% in the South. Colorectal cancer is the second leading cause of cancer death in Europe, and timing changes everything: 5-year survival goes from 13% at the metastatic stage to 91% when the cancer is still localized.

35.8%
screening uptake in Italy, 2024 [1]

21.1%
in Southern Italy and the islands [1]

91% / 13%
5-year survival, localized vs metastatic [2]

THE SOLUTION

A four-part system: a 28 × 12 mm **capsule** with cameras, biosensors (temperature, pH, reactive oxygen species, haemoglobin) and on-board AI; a **vest** with antennas that receives the signal and locates the capsule; a **receiver** that records the transit; an **app** that turns the data into a gut health index and tracks it over time.

TWO VERSIONS, TWO MARKETS

ARGO-GIM Lite · B2C, personal health. Helps people understand and follow their gut health over time, and points them to a doctor when something changes.

ARGO-GIM Dx · B2B, clinical use. Dual RGB and NBI cameras, 3D vision, lesion classification (Paris, Kudo, NICE) and FHIR integration. The AI works alongside the doctor as a second look.

ARGO-GIM is a concept in development, not a certified medical device. Product figures are design targets to be clinically validated; projections are internal estimates.

MARKET

$40.4 bn
global colorectal screening market, 2025 [3]

8 M
people invited to screening every year in Italy [1]

+7.9%
annual growth of capsule endoscopy [4]

BUSINESS MODEL

- Single-use capsule: every exam is a new capsule
- Software subscriptions: Lite app and Dx licences per hospital unit
- Licensing of technology and of anonymised data, with consent only

PROJECTIONS

Our internal projection reaches operating break-even in year 2 after launch and €67 M revenue in year 5, with fewer than 4% of the people invited in Italy. Year 1 is the first year after CE marking. Assumptions to be validated with the bill of materials and first agreements.

REGULATORY PATH AND ROADMAP

An ingestible capsule is an invasive medical device under EU Regulation 2017/745 (at least class IIa): both versions require CE marking. The project is designed around the MDR, the AI Act and the GDPR.

TODAY
Concept and design — Working prototype — Preclinical tests — Clinical studies — CE marking

THE NEW-TALE TEAM

Niccolò Vono
PhD student in Biotechnology for Molecular Medicine, colorectal cancer multi-omics

Cristina Vocca
PhD student in Public Health, resident in Clinical Pharmacology and Toxicology

Giuseppina Fruci
Pharmacy student

Technical and technology partner: Biotecnomed

WHAT WE ARE LOOKING FOR

- Electronic and biomedical engineering for the prototype
- Gastroenterology units for clinical studies
- Medtech mentors and investors
- Healthcare providers for pilot projects
